

Pelco & ICx Cameleon V4 Software

BY CAREY D. SCHOCK, MANAGING EDITOR

In our continued quest to provide the most innovative solutions to our customers, Pelco is proud to work with ICx 360 Surveillance, a leading supplier of state-of-the-art control and display software. The advanced software platform 360 Surveillance delivers provides unique functionality when utilized with Pelco video security solutions.

ICx 360 Surveillance's Cameleon 4 software works seamlessly with Pelco and other third-party imaging and recording systems. This off-the-shelf software allows users to view and control IP and analog video simultaneously through a single interface. "One of the many benefits for Pelco customers is the ability to share video between disparate systems," explains Mark Brown, General Manager of 360 Surveillance. "Our solution offers support for all analog, digital, or hybrid systems."

This platform can be easily configured to fit the requirements of any project through the use of device drivers and automation. Built upon flexible software architecture, Cameleon V4 currently offers more than 200 device drivers and can easily develop additional drivers for new devices. Control center integration includes display clients that can be utilized to create video

walls with different IP streams, automation of large format video wall processors, VGA and audio switches. Also, when used in conjunction with ICx ground based radar detections systems, Cameleon can display radar targets on maps and automatically track targets with Pelco cameras.

Pelco Director of Integration Dave deLisser is enthusiastic about the relationship between ICx 360 Surveillance and Pelco. "We are very impressed with the ICx Cameleon command and control platform and how well it works with the Pelco product line. Together we provide a very powerful solution that satisfies the demanding requirements of our customers."
