

Terminal Rodoviário Tietê

ON THE ROAD TO SECURITY

“Pelco offers excellent quality and an excellent technical team in Brazil to support all of our needs.”

- Luis Carlos Perez E. Leon Huici, Enigeer for Alkanse, Project Integrator

MISSION

As one of the busiest, most-visited bus terminals in the world, the Tietê Interstate Bus Terminal in Sao Paulo, Brazil, needed a world-class video security system. In addition to the security component and the ability to efficiently allocate resources in emergency situations, the video system also needed to help managers improve employee training and increase operations efficiencies.

SOLUTION

Opening a new operations center in 2004, the terminal uses a combination of 61 Pelco cameras, digital video recorders and monitors for an around-the-clock video security presence. Spectra III Positioning Systems provide powerful day/night capabilities, integral in such an installation. In addition to these and color/black-white models, high-resolution fixed cameras and DX7100 Series Digital Video Recorders were also used.

RESULT

The use of such a combination of video security technology facilitates the security operations at the terminal, expedites incident response time and contributes to an increased sense of safety and security for passengers and employees alike. Operators and security personnel now have the ability to view everything taking place inside the buildings as well as to detect problems and rapidly trigger appropriate personnel response. Monitoring also extends to vehicle traffic around the terminal as well as to escalators, elevators, sound systems and fire fighting equipment.
